S. Loffe

**Improvement of the krasnozem soils by organic substances.** 1. A. Malomakhtova, N. V. Strel'tsova, K. N. Tikhonova, T. A. Tsvetkova, I. S. Dzhelilova, 1938, no. 82, *Khim. Kser. Zhur.*, 1939, No. 7, p. 50. Absorption of humus substances (from Na humate) by 2 samples of krasnozem soils was investigated. The experiments were performed (1) by a single treatment of identical samples of soil (with a 1:25 ratio of the wt. of the sample to the vol. of the soln.) with humate solns. of various concns., at pH 6.8, and (2) same as (1), but 3 times and with drying of the solid phase after each treatment with Na humate in a thermostat at 35-40° for 24 hrs. The amt. of the absorbed humate was detd. by the C content in the solid phase. A direct proportionality was found between the absorption of humus substances by the soil and their concn. The exchange acidity, the exchange Al and the absorption capacity of the cations and the phosphate ions were investigated. With an increase of the amt. of the absorbed humus substances the exchange acidity and the amt. of the exchange Al in the krasnozem soils decreased. The absorption capacity of soils increased in relation to the cation. A complete additivity of the capacities of the initial soils and the added org. substances was not found. The absorption of the phosphate ions (from a 0.01 M  $\text{KH}_2\text{PO}_4$  soln.) by the soil samples high in humus decreased from 762 mg. to 352 mg. of  $\text{P}_2\text{O}_5$  100 g. of the soil.

A simplified method for the separation of the loosely held humus substances from chernozems. I. A. Mal'makova. *Sbornik Fiziko-Khim. Issledovaniy Pochv*. Tifl'skii 1938, 20, 4; *Khim. Referat. Zhur.* 1939, No. 1, 48. Treat 5 g. of chernozem soil for 1 hr. in a rotator with 250 cc. of a 0.5% soln. of NaOH. Ppt. the org. mineral part by adding 3 g. of KCl. Det. the content of the humus substances in the soln. colorimetrically by comparing with a standard soln. Det. the total amt. of the loosely held fraction (II) of the humus substances and the more closely held fraction (III) on another sample of the soil (10 g.) by treating it with 300 cc. of a 0.2 N soln. of NaOH for 1 hr. in a rotator after the removal of the mobile  $P_2O_5$  by a treatment with a 0.05 N soln. of HCl (3 times). Ppt. the org. mineral part with KCl. Det. the content of the humus substances colorimetrically. II is deduced from the difference between this and I. W. R. Hyun and L.

studies are conducted by practical firing of small-caliber cartridges at various targets set up on electrified miniature firing grounds. The author concludes that this version of the organization of tank firing training in a company is not necessarily a pattern to be followed by other companies since methods of conducting training exercises and the subject matter of the training problems must be determined each time depending upon the specific conditions and tasks performed by the units. Orig. art. has: 2 figures.

TITLE: Let us improve the firing training of military tank crews

SOURCE: Vojennyy vestnik, no. 12, 1965, 99-103

TOPIC TAGS: gunnery training, military tank, military personnel

ABSTRACT: This article presents one of the versions of organizing and conducting tank firing training. Tank firing training is conducted systematically two times a week for two hours each. As a rule the exercises are organized at three training sites by platoons. At the first training site the students acquire basic skills in firing, for which purpose conditions are created which are as close as possible to actual firing from tanks. The second training site is intended for training in reconnaissance of targets by observation, determination of distances, and presenting target designation. At this training site there are mobile and pop-up targets as well as camouflaged fixed targets at ranges from 800 to 2000 m. In the observation sector of each crew there are five or six different targets. The members of the crews, observing the battlefield through instruments, study the terrain, seek out the targets, determine the range to them, and present target designations. At the third site training is in the use of firing rules and in the solution of firing problems. The

transducer resistance in ohms;  $R_s$  is the shunt resistance in ohms,  $h$  is the calibrating signal in mm,  $E$  is the elastic modulus in kg/mm<sup>2</sup> and  $S$  is the sensitivity coefficient of the transducer. The experiments allowed graphs of the steel life to be plotted in log coordinates. It was concluded that the increased static resistance of the steel results in lower 'relative' limit of impact fatigue. The mechanical strength is raised at lower temperatures. The same phenomenon is noticed with the impact fatigue, although it varies with the steel mark. The strength during variable loading is determined by the surface layers, i.e. by the machining and type of strain hardening. An example is given of the application of fatigue curves for calculating components working in conditions of repeated impacts. The actual values of impact resistance may differ from those obtained by the above method. A mention is made of determining the scatter by introduction of a so-called individual scatter factor. There are 5 figures, 4 tables and 4 Soviet-bloc references.

TITLE: The impact strength of some structural steels

PERIODICAL: Vestnik mashinostroyeniya, no. 4, 1962, 7 - 13

TEXT: The author describes an investigation of the impact strength of some steels, whose chemical composition, heat treatment and mechanical properties are tabulated. The examination was carried out on square section specimens with a rounded shoulder for stress concentration. Some of the items were subject to work-hardening by shot blasting. The experiments took place at ambient temperatures from -20 to -60°C. The test stand was equipped with two discs ensuring the change in the sign of the load. The stresses were measured by a strain gauge. The actual load was determined by use of a transfer factor,  $K_n$  which was derived by the optical polarization method.

The stress was evaluated by  $\sigma = \frac{R_t L E K_n}{R_s h S}$  kg/mm<sup>2</sup>, where  $R_t$  is the

TITLE: A method for producing hydraulic fluid. Class 23, No. 172947

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 14, 1965, 65

TOPIC TAGS: hydraulic fluid, petroleum product

ABSTRACT: This Author's Certificate introduces a method for producing hydraulic fluid based on petroleum products. The efficiency of the fluid at low temperatures is improved by using a velosite distillate with a flash point of 115-120°C and a viscosity of less than 2200 centistokes at -40°C.

Impulse-Phase-Modulation

modulation and amplitude modulation of the radio transmitter are given. The curves of the noiseproof feature have two characteristic points. One of them corresponds to the threshold of impulse-phase-modulation and the other to the threshold of frequency modulation improvement. The results obtained by comparing the noiseproof feature of a system with impulse-phase-modulation and amplitude modulation of the radio transmitter with the system of frequency modulation with single-band frequency condensation, which is the most frequently used, are given. By way of a summary it is said that the system of a multi-channel transmission, which is described in this paper, may be recommended for use in a number of cases. There are 8 figures, 3 tables, and 8 references, 5 of which are Soviet.

Fluctuation Noises on Radio Lines With Frequency Modulations  
During the Transmission of a Multi-Channel Signal With Impulse-  
Phase-Modulation (Fluktuatsionnyye pomekhi v radioliniyakh s  
chastotnoy modulyatsiyey pri peredache mnogokanal'nogo signala  
s impul'sno-fazovoy modulyatsiyey)

PERIODICAL:

Radiotekhnika, 1958, Vol. 13, Nr 7, pp. 11-24 (USSR)

ABSTRACT:

On the strength of the results obtained by the works dealing with fluctuation noises in the case of frequency modulation (Refs 5,6) the problem of protecting the system (used for the transmission of signals with impulse-phase-modulation by means of frequency modulation) from noises is investigated. Only such noises as occur in the interior of the input circuits of the receiving set are dealt with (i.e. the fluctuation noises). Analysis is carried out both for a strong and for a weak signal. The threshold of the system is determined. The influence exercised by the parameters of the system upon the noiseproof feature is evaluated. Diagrams for the determination of the noiseproof feature in the radio lines of the system of a multi-channel transmission with impulse-phase-

the track, the rolling of the vehicle onto it, the connection of the end links, and the pressing in of the closing track pin (see Fig. 1). To save effort, the track band is placed vertically in the form of a semi-loop and fastened, its upper end raised so that the idler wheel can pass under it. The tractor is rolled onto the lower part of the track, the upper part of which is then lowered on the track drive sprocket, which tightens the track to close the end links. 300 -- 100K. The results show that the capture cross section depends also on the number of dislocations in the crystal, and that smaller values of n are obtained with samples having a smaller number of dislocations. Apparently, experimental values of n are larger than the theoretical ones because the theory does not provide for the contribution of the structural defects. "The authors thank Ye. G. TITLE: On the temperature dependences of the capture cross section of holes by  
impurity centers in germanium 44, 65

SOURCE: Fizika tverdogo tela, v. 7, no. 6, 1965, 1894-1897

TOPIC TAGS: germanium, semiconductor impurity, capture cross section, temperature  
dependence, impurity center

ABSTRACT: The authors present new experimental data on the temperature dependence  
of the cross section for the capture of holes by doubly charged iron ions in  
germanium, and discuss one possible reason why earlier experiments yielded for the  
theoretical relation  $\sigma_k \sim T^{-n}$  ( $\sigma_k$  -- capture cross section,  $T$  -- temperature,  $n$  --  
an exponent ranging between 1 and 4) values which were higher than predicted by the  
theory. The study is based on an earlier paper (FTT v. 5, 3043, 1963), the results  
of which have made possible to determine exactly the lifetime of the holes captured  
by the Fe<sup>++</sup> ions. The procedure consists of measuring the photomagnetic emf in  
low-resistivity n-Ge doped with iron at different intensities of modulated light,  
with constant additional illumination and without it, in the temperature interval

TITLE: The amino-acid composition of photosynthesizing bacteria

SOURCE: Mikrobiologiya, v. 34, no. 5, 1965, 753-756

TOPIC TAGS: bacteriology, photosynthesis, amino acid, photosynthesizing bacteria

ABSTRACT: The amino-acid composition of the whole-cell protein of four species of purple and green sulphur bacteria was investigated, and comparisons were made. Eighteen amino acids were found in significant amounts in protein hydrolyzates of purple bacteria (*Rhodopseudomonas* sp., *Chromatium minutissimum*) and green bacteria (*Chlorobium thiosulfatophilum* and *Chloropseudomonas ethylicum*). It was found that these species of photosynthesizing bacteria do not differ from each other in the qualitative composition of amino acids. Study of the quantity of individual amino acids showed that in most cases both species of green bacteria are similar. The purple bacteria, however, differ from each other in percentage content of certain amino acids (see Table 1). It is

ABSTRACT: Authors studied the coprecipitation of thallium with  
 $\text{In}_2\text{S}_3$  by methods of isomolar series and constant concentration  
of one component. Authors found that this causes the formation  
of a chemical compound with the ratio  $\text{Tl} : \text{In} = 1 : 2$ . The  
compound obtained has the composition  $\text{TlIn}_{2}^{+}\text{S}_3^{-}$ . X-ray studies

confirmed by X-rays. Coprecipitation diagrams show fields
